

Compressed Air Turning Systems

Platinum 24V DC Cabinets

Description

All compressed air turn systems will ship uninstalled from the console.

The penetrations through the backplate will be present and plugged, however the valves and pressure switches must be field-installed.

As such, two airline packs will be shipped as part of the AUX part for each cabinet:

- Console Airlines (1001048 single depth, 1001077 double depth)
- Cabinet Drops (FB6579 single depth, FB6580 double depth)

Technicians will need to install the console airlines, pressure switches and pneumatic valve into the console. Consult *24VDC Console Procedure* for further information.

Advisory

Please note that the 24V DC consoles have a 3/8" compressed air supply line, compared to a 1/4" supply line on the classic Platinum.

24V DC consoles **must have an independent air supply filter and regulator assembly**, even if on a bank with Platinum classic machines.

The standard rule of 7 cabinets per filter/regulator assembly still applies to these cabinets.
